Features

- Isolated Substrate
 - High isolation voltage (>2500V)
 - Excellent thermal transfer
 - Increased temperature and power cycling capability
- IXYS advanced low Q_g process
- Low gate charge and capacitances
 - Easier to drive
 - Faster switching
- Low $R_{DS(on)}$
- Very low insertion inductance (<2nH)
- No beryllium oxide (BeO) or other hazardous materials

Advantages

- Optimized for RF and high speed switching
- Easy to mount—no insulators needed
- High power density

Note:

1. ALL LEADS ARE PURE MATTE TIN PLATED.
2. Cu SURFACE OF BOTTOM DCB IS PRE-Ni PLATED UNLESS OTHERWISE STATED
3. Cu SURFACE OF BOTTOM DCB IS ELECTRICALLY ISOLATED 2,500V AC FROM ALL OTHER LEADS.
4. PIN 2 N/A, missing, used for device orientation.

Fig. 13 Footprint and PCB layout

For optimum results, multiple pins of the same type should be grouped together on the PCB as shown below. This assures wide traces to the attached driver and load, minimizing parasitic inductance. The source pin groups, SG1, SG2, SD1, SD2, are all source connections at the die. For best operation, the source groups would be ideally incorporated into a large contiguous ground plane on the same side of mounting on the circuit board. In other words, instead of routing ground traces to the device during layout, the footprint would be set over a large ground plane with drain and gate traces routed out of the ground plane. This is done during layout by first establishing a polygon that covers the entire PCB, representing the ground plane, and that is 'poured' around needed traces by the layout software.
